

PDF Filer II V – the productive way to name your PDF Files

PDF Filer II V is a utility that allows a user to productively file PDF documents in a one tier file folder hierarchy.

It is ideally suited for use with a copier that scans to a file folder on the network. It will monitor the output folder from a copier for PDF files. When one arrives, it notifies the user and provides a quick way to review and file the document. It eliminates the need to browse to a folder on the copier's keypad and name a file.

- Eliminates the need to manually open a file, close the file, move the file and rename it.
- Eliminates wasted time using the small keyboard on the copier
- Standardizes Filing
- Can be used with Blank Page Splitter or Barcode Batch Separator for scanning and processing in a Batch Mode
- Allows for document review before filing
- Automatically Appends existing files
- Can also be used with any open PDF on the users local PC
- Only requires Acrobat Reader
- Can be Customized for the users document type

PDF Filer II V Single Copy \$295.00
